

DARKFIGHTER BUILT-IN K9 CAMERA

Ready in 5s

VS The DarkFighter Built-in K9 Camera System is engineered to enhance situational awareness for K9 handlers, allowing them to maintain a clear visual connection with their canine companions in various environments. System integrated into the DarkFighter K9 Helmet. One of its standout features is the ability to transmit live video feeds seamlessly, ensuring that handlers receive real-time visuals even when positioned up to 490 ft (150 meters) away from the dog. This capability is crucial for tactical operations where maintaining a safe distance while monitoring the K9's activities can be essential.

The elimination of latency is crucial in maintaining the operational efficiency and effectiveness of K9 units. By streaming live video without time lag, handlers can respond to the actions and are sure not to miss a moment, such as a dog poking its head into a room, etc. The DarkFighter analog technology is specially designed to offer a near to zero latency video streaming in challenging environments with interferences. This camera lets handlers see exactly what their dog sees, eliminating the skewed angles and limited views of traditional dog-mounted cameras by integrating seamlessly into the helmet for a clear, uninterrupted live feed in any environment.

The tactical monitor allows you to keep an eye on the progress of operations while maintaining control of your equipment. In an emergency, there's no need to drop the screen to take hold of your weapon or your dog. This tactical monitor can be used by other team members to follow the situation in real time. Small enough to fit in a Cargo Pouch.
